

Group 29 Pitch

Boom Boom Powell

PocketPass
the Business-Card Wallet

Statement of Purpose

Problem We Solve:

- Networking events still rely on fragile, single-purpose paper cards.
- Existing digital-card tools force sign-ups, hide data behind paywalls, or require proprietary apps.
- Cross-platform sharing is inconsistent; users want a friction-free hand-off that works even offline.

Target Users:

- Students and early-career professionals who network frequently but lack budget for paid SaaS cards.
- Event organizers who need a low-tech, privacy-respecting solution for attendee info exchange.
- Privacy-conscious users who prefer local-first storage and open-source tooling.

6-week MVP Objectives

- Create / Edit / Delete contact cards locally (IndexedDB).
- Display cards in a scrollable “wallet” list and detail view.
- Share a card via a dynamically generated QR code; Receive by scanning.
- Optional Web NFC tap share on supported Android devices.
- 100 % offline functionality, installable PWA, and no login requirement.

Key Differentiators

- Schema-lite cards (easy to extend in v2).
- 100 % client-side—users own their data.
- Completely free & open source; tiny codebase (HTML + CSS + ES modules, no framework).

Development Principles:

- Maintainability; each feature should be added with a clear purpose in mind to avoid clutter.
- User-centered design
- Follow software best practices and work on accessibility
- Prioritize user data privacy

User Stories #1

Name: Stuart Student

Details: High School/University Student looking to expand network both for student connections and outreaching companies/hiring managers.

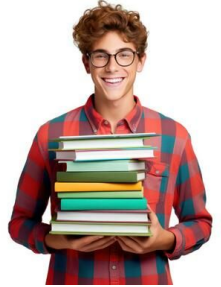

Wants & Needs:

- Make it quick + easy to add other people to your folder of business cards
- Easy to access/add information on cards (Ex. professional template that looks appealing and has preset info such as GitHub/LinkedIn and maybe a quick easy way to access resume)
- Notes features to annotate/distinguish new connections (ex. Where they met them)
- Create folders to categorize connections (Ex. Hiring managers, other students, coworkers)
- Some metric to display how “good you are doing” in the realm of networking (Ex. connections, past jobs, etc.)
- Easy to distinguish people’s intention for the app (casual or business)

Don'ts:

- Don't really care about visually appealing UI (compared to a casual user who uses it as decoration)
- Less features to reduce complexity, both on the users and developers side
- “Useless entertaining/engaging features” (Ex. quest/achievement that gives exclusive banner/border, leveling system in terms of cosmetics).

User Story: As a student, I want to prioritize networking by making connections smoothly to people in the industry (other students, coworkers, hiring managers) so that I can get a job when I graduate and learn more about my field of interest.

User Stories #2

Name: Casey Casual

Details: A casual user who uses the app more as a way to express their personality and creativity. Would enjoy seeing others using the same tools to display themselves uniquely.

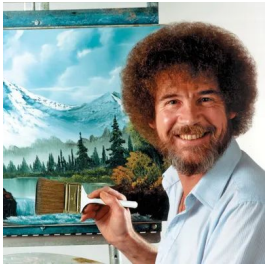

Wants & Needs:

- Lot's of preset cosmetics/decorations
- Ability to upload your own templates/features
- Easy to access/add information on cards
- Make it quick + easy to add other people to your folder of cards
- Ability to make multiple cards (Ex. could be part of different communities, so displays in depth passion for each)
- A space for specific groups/interests
- Easy to distinguish people's intention for the app (casual or business)

Don'ts:

- No ads!
- Identity of the app should not be completely business focused (Ex. neglecting creativity features in favor of business features)

User Story: As a casual user, I want my card to be an expression of myself, featuring a lot of customizability and character, so that I can reflect who I am to other people and learn more about them.

User Stories #3

Name: Preston Professional

Details: A professional who has been working for a while. Looking for life-long connections to keep them in the loop/market. Want to keep track of companies they see a future with

Wants & Needs:

- Connection filter system (Ex. only adding through QR code to ensure genuine connections)
- Ensures efficiency over aesthetics (Ex. doesn't want lag or formatting issues)
- In addition to individuals, companies have specific cards that describe their values and work-life balance.
- Actual printable cards that display a QR code that leads to digital card

Don'ts:

- Ability to add people spontaneously (Ex. no cold-messaging to add connection)
- Don't care as much about visual aesthetic (Just wants simple to read professional look)

User Story: As a professional, I want to make selective, meaningful connections in the workforce so that I can maintain a presence in the industry and collaborate with those that truly align with my values/ideals.

User Stories #4

Name: Monica Manager

Details: An executive/hiring manager seeking new hires that align with company values and bring something innovative to the table.

Wants & Needs:

- Adding on to the annotation feature, a streamline process to assess other cards (Ex. rating to see their fit in the company)
- Actual printable cards that display a QR code that leads to digital card
- Sectioning of professional business cards (Ex. professional experiences, values, what you have to offer)

Don'ts:

- Cold messaging system (undermines professionalism), some sort of permission must be given to connect (Ex. QR Code)

User Story: As an executive/hiring manager, I want to find those who are the best fit for my company so that I can employ those who can bring the most for my company's growth.

Risks and Rabbit-Holes

Risk 1

- Category: Difficult to get started
- Description: The app might be too complicated for users to quickly create or browse cards.
- Impact: Medium
- Likelihood: Low
- Mitigation Strategy: Keep user flows minimal and test early prototypes with real users.
- Owner: UI Designer / Team
- Status: Open

Risk 2

- Category: Performance
- Description: If there are too many cards, loading and searching might slow down, which causes unsatisfied user experience.
- Impact: Medium
- Likelihood: Low
- Mitigation Strategy: Keep cards clustered and schedule them by proper strategy like database if necessary.
- Owner: Programmer / Designer
- Status: Open

Risks and Rabbit-Holes

Risk 3

- Category: User Security
- Description: The cards might contain personal information like email, phone number and picture. It's unsafe if someone gets it and posts it somewhere else.
- Impact: Medium
- Likelihood: Medium
- Mitigation Strategy: Provide clear security policy to remind users not to put too private personal information on the card. Also, enable users to control sharing.
- Owner: Designer / Whole Team
- Status: Open

Rabbithole 1

- Area: Feature Creep
- Description: Uncontrolled addition of new features not planned
- Consequence: This can lead to increased development time and complexity. In addition, teams wouldn't be completely synchronized.
- Likelihood: High
- Prevention / Guardrails: An environment that encourages asking questions. Very articulate and descriptive issues.
- Owner: Design Team / Team Lead

Risks and Rabbit-Holes

Rabbithole 2

- Area: Unnecessary Libraries or Frameworks
- Description: Using too many complicated technologies that aren't needed for our use cases.
- Consequence: Increased complexity and a low understanding of how our project works.
- Likelihood: Medium
- Prevention / Guardrails: We thoroughly discuss and plan out what libraries and technologies are used beforehand to gauge the complexity of our project.
- Owner: Team Lead / Entire Team

Rabbithole 3

- Area: Learning New Technologies
- Description: Using technologies that a team member is unfamiliar with.
- Consequence: This can leave team members feeling like they don't understand the project. This can also complicate planning times
- Likelihood: High
- Prevention / Guardrails: We can leave time in the issues and tickets for developers to learn the languages.
- Owner: Planning Team / Entire Team
